

D1
C1
ratio of 2x (or higher) than that observed for an unrelated probe in the particular hybridization assay indicates detection of a specific hybridization. Nucleic acids which do not hybridize to each other under stringent conditions can still be substantially identical if the polypeptides which they encode are substantially identical. This occurs, e.g., when a copy of a nucleic acid is created using the maximum codon degeneracy permitted by the genetic code.

IN THE CLAIMS:

Please cancel claim 25.

Please replace claims 1, 8, 19, 20, 24, 26, and 36 with the following clean copies of the amended claims. A marked up version showing the amendments is provided in Appendix A, attached hereto.

sub
C2
1. (amended) An isolated or recombinant nucleic acid encoding menin, wherein said nucleic acid encodes a protein defined as follows:
(i) having a calculated molecular weight of about 67.5 kDa; and
(ii) (a) specifically binding to a specific polyclonal antibody raised against a protein with a sequence as set forth in SEQ ID NO:2; or
(b) having at least 60% amino acid sequence identity to a protein with a sequence as set forth in SEQ ID NO:2.

C3
8. (amended) The isolated or recombinant nucleic acid of claim 1, wherein the nucleic acid sequence specifically hybridizes to SEQ ID NO:1 under stringent hybridization conditions comprising 50% formamide at 42°C and wash conditions comprising 0.2XSSC at 65°C for 15 minutes.

sub
D1
C4
19. (amended) A method for detecting in a test sample the presence or absence of a mutation in a nucleotide sequence essentially encoding human menin or the presence or absence of a MEN1 allele comprising;

C4
a) contacting said test sample suspected of missing a MEN1 allele or encoding a mutant form of the human menin with a first oligonucleotide having a sequence that discriminates between the wild type gene and the missing allele or mutant form, wherein the first oligonucleotide specifically hybridizes to a nucleic acid sequence comprising at least 95% identity to SEQ ID NO:3; and,

b) detecting the formation of a duplex between the gene and the first oligonucleotide sequence.

20. (amended) A method of claim 19, wherein the first oligonucleotide is unable to bind to the wild-type MEN1 gene under hybridization conditions in which the first oligonucleotide binds to the mutant sequence of MEN1.

24. (amended) A kit for detecting in a test sample the presence or absence of a mutation in a nucleotide sequence encoding a menin polypeptide, the kit comprising;

C5
a) a container holding a first oligonucleotide sequence that discriminates between the wild type gene and the mutant form, and that specifically hybridizes to a nucleic acid sequence comprising at least 95% identity to SEQ ID NO:3; and

b) a container holding a reagent for detecting the formation of a duplex between the gene and the first nucleotide sequence.

C6
26. (amended) The kit of claim 24, further comprising amplification primer pairs specifically binding to a human genomic DNA sequence encoding menin.

36. (amended) An expression cassette comprising a nucleic acid encoding a menin polypeptide, wherein the nucleic acid is operably linked to a promoter.
